Brent's Algorithm (Cycle detection)

Let $x_0 \in S$ be an element of the finite set S and consider a function $f : S \to S$. Define

$$f_k(x) = \begin{cases} x, & k = 0 \\ f(f_{k-1}(x)), & k > 0 \end{cases}.$$

Clearly, there exists distinct numbers $i, j \in \mathbb{N}$, $i \neq j$, such that $f_i(x_0) = f_j(x_0)$.

Let $\mu \in \mathbb{N}$ be the least value such that there exists $j \in \mathbb{N} \setminus \{\mu\}$ such that $f_\mu(x_0) = f_j(x_0)$ and let $\lambda \in \mathbb{N}$ be the least value such that $f_\mu(x_0) = f_{\mu+\lambda}(x_0)$.

Given x_0 and f, this code computes μ and λ applying the operator f $\mathcal{O}(\mu + \lambda)$ times and storing at most a constant amount of elements from S.

cd_brent.cpp

```
p = l = 1;
t = x0;
h = f(x0);
while (t != h) {
    if (p == l) {
        t = h;
        p*= 2;
        l = 0;
    }
    h = f(h);
    ++l;
}

u = 0;
t = h = x0;
for (i = l; i != 0; --i)
h = f(h);
while (t != h) {
    t = f(t);
    h = f(h);
    ++u;
}

/*
 *  \mu = u
 * \lam = l
 */
```

2 Counting

Catalan Numbers

C_n is:

- The number of balanced expressions built from n pairs of parentheses.
- The number of paths in an $n \times n$ grid that stays on or below the diagonal.
- The number of words of size $2n$ over the alphabet $\Sigma = \{a, b\}$ having an equal number of a symbols and b symbols containing no prefix with more a symbols than b symbols.

It holds that:

$$C_0 = 1, C_{n+1} = \sum_{k=0}^{n} C_k C_{n-k}$$

$$C_n = \binom{2n}{n} - \binom{2n}{n-1} = \frac{1}{n+1}\binom{2n}{n} = \frac{(2n)!}{n!(n+1)!}$$

Stirling Numbers of the First Kind

$\begin{bmatrix} n \\ k \end{bmatrix}$ is:

- The number of ways to split n elements into k ordered partitions up to a permutation of the partitions among themselves and rotations within the partitions.
- The number of digraphs with n vertices and k cycles such that each vertex has in and out degree of 1.

It holds that:

$$\begin{bmatrix} n \\ 0 \end{bmatrix} = \begin{cases} 1, & n = 0 \\ 0, & n \neq 0 \end{cases}, \quad \begin{bmatrix} 0 \\ k \end{bmatrix} = \begin{cases} 1, & k = 0 \\ 0, & k \neq 0 \end{cases}$$

$$\begin{bmatrix} n \\ k \end{bmatrix} = (n-1)\begin{bmatrix} n-1 \\ k \end{bmatrix} + \begin{bmatrix} n-1 \\ k-1 \end{bmatrix}$$

$$\begin{bmatrix} n \\ 1 \end{bmatrix} = (n-1)!$$

$$\begin{bmatrix} n \\ n-1 \end{bmatrix} = \binom{n}{2}$$

$$\begin{bmatrix} n \\ n-2 \end{bmatrix} = \frac{1}{4}(3n-1)\binom{n}{3}$$

$$\begin{bmatrix} n \\ n-3 \end{bmatrix} = \binom{n}{2}\binom{n}{4}$$

$$\begin{bmatrix} n \\ 2 \end{bmatrix} = (n-1)!H_{n-1}$$

$$\begin{bmatrix} n \\ 3 \end{bmatrix} = \frac{1}{2}(n-1)!\left(H_{n-1}^2 - H_{n-1}^{(2)}\right)$$

$$H_n = \sum_{j=1}^{n} \frac{1}{j}, \quad H_n^{(k)} = \sum_{j=1}^{n} \frac{1}{j^k}$$

$$\sum_{k=0}^{n} \begin{bmatrix} n \\ k \end{bmatrix} = n!$$

$$\sum_{j=k}^{n} \begin{bmatrix} n \\ j \end{bmatrix}\binom{j}{k} = \begin{bmatrix} n+1 \\ k+1 \end{bmatrix}$$

Stirling Numbers of the Second Kind

$\left\{\begin{matrix} n \\ k \end{matrix}\right\}$ is the number of ways to partition an n-set into exactly k non-empty disjoint subsets up to a permutation of the sets among themselves. It holds that:

$$\left\{\begin{matrix} n \\ 0 \end{matrix}\right\} = \begin{cases} 1, & n = 0 \\ 0, & n \neq 0 \end{cases}, \quad \left\{\begin{matrix} n \\ 1 \end{matrix}\right\} = \left\{\begin{matrix} n \\ n \end{matrix}\right\} = 1$$

$$\left\{\begin{matrix} n \\ k \end{matrix}\right\} = \left\{\begin{matrix} n-1 \\ k-1 \end{matrix}\right\} + k\left\{\begin{matrix} n-1 \\ k \end{matrix}\right\}$$

$$\left\{\begin{matrix} n \\ k \end{matrix}\right\} \bmod 2 = \begin{cases} 0, & (n-k) \& \lfloor \frac{k-1}{2} \rfloor \neq 0 \\ 1, & \text{otherwise} \end{cases},$$

where & is the C bitwise "and" operator.

$$\left\{\begin{matrix} n \\ 2 \end{matrix}\right\} = 2^{n-1} - 1$$

$$\left\{\begin{matrix} n \\ n-1 \end{matrix}\right\} = \binom{n}{2}$$

$$\left\{\begin{matrix} n \\ k \end{matrix}\right\} = \frac{1}{k!}\sum_{j=0}^{k}(-1)^{k-j}\binom{k}{j}j^n$$

Bell Numbers

$\mathcal{B}_n$ is the number of equivalence relations on an n-set or, alternatively, the number of partitions of an n-set. It holds that:

$$\mathcal{B}_n = \sum_{k=0}^{n} \left\{\begin{matrix} n \\ k \end{matrix}\right\}$$

$$\mathcal{B}_{n+1} = \sum_{k=0}^{n} \binom{n}{k}\mathcal{B}_k$$

$$\mathcal{B}_n = \frac{1}{e}\sum_{k=0}^{\infty} \frac{k^n}{k!}$$

$$\mathcal{B}_{n+p} \equiv \mathcal{B}_n + \mathcal{B}_{n+1} \pmod{p}$$

The Twelvefold Way

Let A be a set of m balls and B be a set of n boxes. The following table provides methods to compute the number of equivalent functions $f : A \to B$ satisfying specific constraints.

Balls	Boxes	Any	Injective	Surjective
$\not\equiv$	$\not\equiv$	n^m	$\frac{n!}{(n-m)!}$	$n!\left\{\begin{matrix} m \\ n \end{matrix}\right\}$
$\not\equiv$	$\equiv$	$\sum_{k=0}^{n}\left\{\begin{matrix} m \\ k \end{matrix}\right\}$	$\delta_{m \leqslant n}$	$\left\{\begin{matrix} m \\ n \end{matrix}\right\}$
$\equiv$	$\not\equiv$	$\binom{m+n-1}{m}$	$\binom{n}{m}$	$\binom{m-1}{n-1}$
$\equiv$	$\equiv$	**(*)** $\sum_{k=0}^{n} p(m,k)$	$\delta_{m \leqslant n}$	**(**)** $p(m,n)$

(**) is a definition and both **(*)** and **(**)** are very hard to compute. So do not try to.

Lucca's Theorem

Let $n, k, p \in \mathbb{N}$ and p be a prime number. Then

$$\binom{n}{k} \equiv \prod_{j=0}^{\infty} \binom{n_j}{k_j} \pmod{p},$$

where n_j and k_j are the j-th digits of the numbers n and k in base p, respectively.

Derangement (Desarranjo)

A derangement is a permutation of the elements of a set such that none of the elements appear in their original position.

Suppose that there are n persons numbered $1, 2, \ldots, n$. Let there be n hats also numbered $1, 2, \ldots, n$. We have to find the number of ways in which no one gets the hat having same number as his/her number. Let us assume that first person takes the hat i. There are $n-1$ ways for the first person to choose the number i. Now there are 2 options:

- Person i takes the hat of 1. Now the problem reduces to $n-2$ persons and $n-2$ hats.
- Person i does not take the hat 1. This case is equivalent to solving the problem with $n-1$ persons $n-1$ hats (each of the remaining $n-1$ people has precisely 1 forbidden choice from among the remaining $n-1$ hats).

From this, the following relation is derived:

$$d_n = (n-1) * (d_{n-1} + d_{n-2})$$

$$d_1 = 0$$

$$d_2 = 1$$

Starting with $n = 0$, the numbers of derangements of n are: 1, 0, 1, 2, 9, 44, 265, 1854, 14833, 133496, 1334961, 14684570, 176214841, 2290792932.

3 Geometry

Convex–hull

al_convexhull.cpp

```
// Calculates the convex hull of a given vector of points.
// Running time: O(n log n) or, if already sorted, O(n)

typedef pair<int,int> Point;
int cross(Point a, Point b) {return a.first*b.second-a.second*b.first;}
int cross(Point O, Point a, Point b) {
  return cross(Point(a.first-O.first,a.second-O.second),
    Point(b.first-O.first,b.second-O.second));
}
template<int M>
void findPoints(vector<Point>& points, vector<Point>& result) {
  for (int i = 0; i < points.size(); i++) {
    Point& p = points[i];
    while (result.size() >= 2 &&
      M * cross(result.end()[-2], result.end()[-1], p) >= 0)
      result.pop_back(); // > 0 keeps collinear points
    result.push_back(p);
  }
}
// USAGE: convexHull(inputPoints, outputPolygon)
void convexHull(vector<Point>& points, vector<Point>& result) {
  vector<Point> lowerResult;
  sort(points.begin(), points.end()); // remove if already sorted
  findPoints<1>(points, result);
  findPoints<-1>(points, lowerResult);
  for (int i = lowerResult.size()-2; i; i--)
    result.push_back(lowerResult[i]);
}
```

Miscellaneous geometry
